

# Slanted inner cap for fence post cut at an angle of 45°

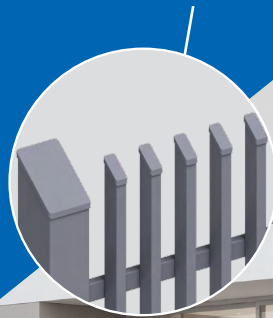

A modern solution made of plastic,  
in various dimensions, which shortens  
the production time of the entire fence.

## Additional properties:

- ◆ aesthetic appearance,
- ◆ perfect fit to profile,
- ◆ frost-resisting,
- ◆ UV-resistant,
- ◆ does not require  
welding,
- ◆ does not rust.

### Current cap sizes:

20x30 mm and 80x80 mm

**The size of your cap is  
not in our offer?**

Let us know and we will prepare  
product especially for you.

## Inner cap for fence post cut at an angle of 45°

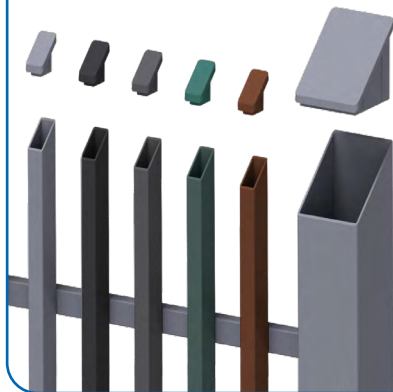

Palisade fences with the use of slanted caps are a traditional solution in a modern version, which will perfectly fit into the space of both private properties and companies. Minimalist design and anti-burglary properties have caused vertical fencing systems to enjoy increasing interest from customers. The result of changing trends in the fencing industry is a move away from popular horizontal fences towards safer vertical fences.

## Material

The material from which we make the caps is Polyethylene - a material with universal applications. Polyethylene is characterized by low abrasion while maintaining resistance to environmental stress corrosion cracking, high dimensional stability even at low temperatures, very good chemical resistance and low water absorption. It is resistant to changing weather conditions and UV radiation. It is also characterized by good electrical insulating properties.

We make caps in black, gray, graphite, green and brown.

**We offer the possibility of making caps on customer's request in other colors and sizes.**

We carry out individual orders at the client's request. We offer a full range of tooling and injection services, from design, tooling production to production implementation. We produce articles for the industrial, fencing and furniture sectors. The goods are characterized by high quality of workmanship. We ensure continuity of supply and quick order fulfillment.
